

Prompt Optimizer Team Handoff Note

This note is for teammates who will download, run, and improve the Prompt Optimizer application.

Project folder: **D:\Prompt Guide\prompt-generator**

What this app does	Turns rough prompts into clearer, better-structured prompts and keeps project history locally.
Main tech stack	Python FastAPI backend, Next.js frontend, SQLite local database.
Best way to share	Upload the project folder to OneDrive, but do not include secret files such as backend/.env.

1. What to Share

- Share the **prompt-generator** folder.
- Do **not** share **backend/.env** because that file contains secret API keys.
- It is also better to avoid sharing generated folders such as **frontend/.next**, **frontend/node_modules**, and any local database or cache files if they are personal or outdated.
- If possible, share a clean copy that includes source code, README, start scripts, and **backend/.env.example**.

2. What Teammates Need on Their Computer

- Python installed.
- Node.js and npm installed.
- Internet access for the AI provider APIs.
- Permission to create a local **.env** file inside the backend folder.

3. First-Time Setup

Ask teammates to follow these steps:

1. Download the shared folder from OneDrive.
2. Open **D:\Prompt Guide\prompt-generator** or their local copy of that folder.
3. In the **backend** folder, make a copy of **.env.example** and rename it to **.env**.
4. Paste their own API keys into that new **.env** file.
5. Install backend and frontend dependencies if needed.
6. Run the launcher script and open the app in the browser.

4. Where API Keys Must Be Stored

All API keys must be kept in this file:

```
D:\Prompt Guide\prompt-generator\backend\.env
```

They should start from the example file below and replace the placeholder values with their own keys:

```
ANTHROPIC_API_KEY=your_anthropic_key_here
OPENAI_API_KEY=your_openai_key_here
GEMINI_API_KEY=your_gemini_key_here
GROQ_API_KEY=your_groq_key_here
DATABASE_URL=sqlite:///./prompts.db
DEFAULT_MODEL=gemini-2.0-flash
OPTIMIZER_MODEL=gemini-2.0-flash
```

5. Which Keys Are Really Needed

- **Recommended minimum:** Gemini key, because the optimizer is set to Gemini by default.
- **Recommended backup:** Groq or OpenAI key, so the app still works if Gemini is unavailable.
- **Anthropic key:** needed only if teammates want to use Claude models.
- If a teammate does not plan to use a provider, they can usually leave that key blank.

6. Where to Get the API Keys

Provider	Official place to get the key
OpenAI	https://platform.openai.com/api-keys
Anthropic (Claude)	https://platform.claude.com/settings/keys
Google Gemini	https://aistudio.google.com/app/apikey
Groq	https://console.groq.com/keys

Each teammate should create and use **their own** keys. They should not reuse your personal keys unless you explicitly want that and understand the billing impact.

7. How to Run the App

Simple launcher files in the project root:

- **Prompt_Optimizer.vbs** starts the app quietly.
- **Prompt_Optimizer.bat** also starts the app and points to the quiet launcher.

If they prefer manual setup:

```
Backend:
cd backend
pip install -r requirements.txt
python -m uvicorn main:app --port 8000 --reload
```

```
Frontend:
cd frontend
npm install
npm run dev -- -p 3001
```

8. Main Folders to Know

- **backend/** - API, database, optimization logic, provider handling.
- **frontend/** - user interface and app screens.
- **backend/services/** - where prompt optimization and provider logic live.
- **frontend/app/project/[id]/page.tsx** - main prompt editor screen.
- **frontend/components/** - reusable UI parts.

9. Safety Notes

- Do not upload the real **.env** file to OneDrive.
- Do not paste API keys into chat messages, tickets, or shared docs.
- If anyone thinks a key was exposed, they should revoke it and create a new one right away.
- Local data may exist in **backend/prompts.db**. Share that only if you want teammates to see the saved history.

10. Good Ways to Improve the App

- Improve response speed and loading feedback.
- Make the UI even simpler for non-technical users.
- Add clearer error messages when API keys are missing.
- Tidy startup, caching, and local data handling.
- Add more testing around optimization results and provider fallback behavior.

Prepared for team sharing. Keep credentials private and let each teammate set up their own API access.
